Guaharibo

123 From the second day onwards their audacity began to become a nuisance. Pots, pans, empty boxes, string, knives and, of course, machetes, constantly excited their greed and began to disappear, to be concealed among the rocks at the foot of the hills. From then on we had to keep our stores, bags and dixies under lock and key. During the daytime they roamed about the camp, driven by curiosity to see so much that was new, but with the night they would again herd together round their [152] fires at the water's edge. They were very jealous of their women-folk and paid them the most touching attention. One [758] of the women was frequently shaken by violent fits of coughing and each time her mate would bring her a gourd of water he had drawn from the river and support her while she drank. When the coughing started again, the poor man's face would take on an expression of powerless solicitude.

595 As far as I could discover the Guaharibos are monogamous 162 and their women are definitely in the minority—as evidenced by the present group of nine men and two women. When, by 578 means of signs and gestures, we asked the unattached males 684 whether they had no wives, the answer was in each case in the negative. Cardona told us that the most common cause of 838 quarrels among them is raping of the women. We thought that homosexuality was also probably common practice. We 201 had no actual proof of this, but saw many instances of ges- 123 tures—usually among themselves, but occasionally directed at us—which were, to say the least, equivocal. To the Guaharibos such gestures were obviously natural and proper behaviour.

123 In order to watch their reactions we fired a few rounds of 411 ammunition. Accustomed to the silence of the forest and trained to hear the least rustle of sound, they betrayed instant terror. Clapping their hands over their ears, they fled. We invited them to demonstrate their own weapons. They handled their powerful bows with astonishing ease and accuracy and could send their light arrows, five to six feet long and made of straight reed stems, nearly a hundred yards. With a termite hill some eighteen inches high and twelve inches across as target, they hit it consistently from fifty yards. Shooting

in terms of women ceded to them by the Shamatari, that they maintain over their Shamatari allies.

The sex ratio data give a rough idea, then, of the extent of female infanticide and, in addition, reflect the political relationships of the villages to each other in terms of the flow of women. Other demographic data, however, suggest that the practice of female infanticide is even higher than the sex ratios alone indicate. Table 2 gives the stated cause of death of 240 adult individuals. These individuals are related to the living members of the three villages of Monou-tedi, Bisaasi-tedi, and Patanowä-tedi. It is immediately apparent that more men die in warfare than women,[1] implying that the frequency of female infanticide is substantially higher than the 8% suggested by sex ratio data.

There are several ways the Yanomamö remedy their woman shortage. Young bachelors, for example, practice sodomy (bei kä bosi kuwemou, bei kä bosi waumou) with each other. These relationships develop into a 'buddy' system (kawä) and promote ties of friendship that extend into adult life. Some of my informants confidentially told me that particular young men had been known to copulate with dogs in estrus, but this was regarded with contempt by all who knew about it. Homosexuality, however, was not considered despicable, but it was thought to be infantile. Most of the

[TEXT CONTINUED ON PAGE 617]

[1] Twenty-two per cent (31/138) of all male deaths were due to warfare, while only 6% (6/102) of female deaths were due to this cause.

838 unmarried young men in Bisaasi-tedi were having homosexual
863 relationships with each other, but no stigma was attached to this behavior. In fact, most of these bachelors joked about it and simulated copulation with each other in public. The men involved in these affairs, however, were hardly more than teenagers; I have no cases of adult men satisfying their
836 sexual needs by homosexuality. By the time a young man is
837 20 to 25 years old, his sexual interests focus on women, and he is constantly attempting to establish liaisons with women,
[564] whether or not they have husbands. In some respects, a man's
[627] status depends on his ability to successfully carry on
[578] clandestine affairs which, when discovered, force him into
[64] club-fights. The number of scars he has on his scalp is a
[554] measure of his sexual prowess.

573 Rarely, a man will permit his brother to have sexual
835 relations with his wife. In the village of Mõmaribõwei-tedi
732 there is an achodroplastic dwarf, YoyosiwÃ. Being 'ugly' (wanidiwÃ), he can not find a wife. One of his normal brothers permits him sexual access to his own wife. In general, however, men are jealous of their adult brothers
595 and do not permit such affairs. Occasionally, if a man has
593 several wives, the wives themselves may put pressure on the husband to give one of them to the man's younger brother; co-wives, too, are capable of being jealous of each other and often resent having to share food, particularly meat. Several young men in Bisaasi-tedi have obtained their wives from older brothers because the latter could not keep peace

sexually active females. Some of the teen-age males have homosexual affairs with each other; the females of their own age are usually married. By the time a young man is twenty years old or so he is anxious to display his masculinity, and at that point becomes a competitor for the sexual favors of the village belles—married belles. This causes considerable friction and results in club fighting. (See Chapter 5.)

Still another factor leads to breeches of the marriage rule: chance. In some villages there are disproportionately more males (or females) of the same lineage because of the way in which the group split from a different village. Again, there may be no eligible females when a young man is old enough to marry. His only choice is to seek a wife in a different village. Rerebawĩ, for example, was forced into this situation. His own village is quite small (about 50 people), but it is dominated numerically by members of his own lineage. Hence, most of the females in the village are related to him as mother, sister, or daughter. The remaining females are married to his older brothers. He therefore came to Upper Bisaasi-teri—an ally of his village—to seek a wife.

Thus, political necessity, cultural practices relating to population control, unequal distribution of women, and chance combine to produce situations in which people cannot follow their prescriptive marriage rules. The factors dealing with politics are the most meaningful in explanations of the discrepancy between Yąnomamö marriage behavior and ideal models of that behavior.

POLITICAL BASIS The importance of politics can be demonstrated by citing a few incidents in the history of several villages and explaining how alliances and hostilities develop over time.

In Chapter 1 I briefly described the political milieu within which Kąobawĩ's village was situated. The relationships that exist at the present time make considerably more sense when they are viewed in the perspective of the historical events that led up to them. The reasons for village fissions and wars and why particular villages have entered into alliances with each other will now be explored briefly.[14]

The more important political ties currently maintained by Kąobawĩ's group have antecedents that go back to approximately 1940. At that time the present villages of Patanowã-teri, Monou-teri, and Upper and Lower Bisaasi-teri were one large village (see Fig. 2-8). In 1940, they were known collectively as the Patanowã-teri. To their south was a series of villages whose residents are collectively known as the Shamatari people. The Patanowã-teri were on friendly terms with most of the Shamatari and frequently visited them in order to trade. Just prior to 1940, an epidemic, probably malaria, resulted in the deaths of a number of Patanowã-teri. The Shamatari were suspected of causing the epidemic by practicing harmful magic. The first Shamatari man to visit the village after the epidemic, Ruwahiwĩ, was treacherous killed by a man who presently lives in Monou-teri; he bashed his head open with an axe. This immediately precipitated a war between the Patanowã-teri and several of the Shamatari villages.

A few years after the war started the Patanowã-teri fissioned into two groups: They relocated their gardens, but remained fairly close to each other geographically. This split was caused by constant bickering within the group and club fights over women. The two new villages thus formed were friendly enough to each other to live in the same

[14] I discussed these relationships in considerable detail in my doctoral dissertation, Chagnon, 1966. The following account is a simplified version.
